Purifying recombinant hepatitis C virus (HCV) El and El envelope

WPI; 1996-129401/13

(first entry)

```
AATI2704-T12709 and AATI2961-T12974 represent hepatitis C virus (HCV) E1 C and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins of the production of recombinant biles by the complex of the constructs. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a carrying out a disulphide bond cleavage agent, after 1 psis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used to vaccinating humans against HCV, for in vitro detection of HCV or the constructs containing the purified HCV envelope proteins can be used to more sero-logical types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated constructs can also be immobilised on a solid substrate and incorporated constructs can also be immobilised on a selid substrate and incorporated the a genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins elected from an B1 and an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV E1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for the virco monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 301 GCTGCTTTCTGTTCCGCTATGTACGTGGGGGATCTCTGCGGATCTGTTTTCCTTGTTTCC 360

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) E1
and E2 protein coding sequence constructs. These sequences are included
in vectors for the production of recombinant E1, E2, and E1/E2 proteins.
The recombinant proteins can then be isolated using a method of the
invention. In the method, the envelope proteins are purified by
carrying out a disulphide bond cleavage, or a reduction step with a
disulphide bond cleavage, or a reduction step with a
classified by and cleavage agent, after 1ysis of recombinant host cells.
The constructs containing the purified HCV envelope proteins can be used
for vaccinating humans against HCV, for in vitro detection of HCV
constructs containing the purified HCV envelope proteins on ex-
more serological types of HCV present in a biological sample. The
constructs can also be immobilised on a solid substrate and incorporated
into a reversed phase hybridisation assay for determining the presence or
the genotype of HCV. The new purification method preserves the
conformation of the recombinantly expressed E1, E2 and E1/E2, and
climinates contaminating proteins. Antigens isolated using this method
are more reactive with human sera than those isolated by known

                             The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligometic recombinant envelope proteins selected from an E1 and an E2 protein, and optionally a pharmaceutical adjuvant. The vaccines useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV E1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for the view omitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention.

1147 CIGCITICIGCICCGCIAIGIACGIGGGGAICICIGCGGAICIGIIIICCICGICICCICC 1206 This sequence is the genome of the non-A, non-B hepatitis virus (NANBHV) strain HC-44. This sequence was derived by amplification by polymerase chain reaction. The nucleotide sequences derived from this amplification can be used to detect NANBHV infection which could not be detected by conventional methods. The detection kits allow highly specific and sensitive detection at an early phase of infection. The polypeptide product of this coding sequence can be used for the manufacture of vaccines and immunological pharmaceuticals and also to produce antibodies specific to NANBHV. gegricessasassechacicerecessariserissecissecessecrescesses CIGCITITCIGITIC CGCTATGIA CGTGGGGGATCT CTGCGGATCTGTTTTCCTTTCCC 362 AGCIGITCACCTICTCACCTCGCCGGCATCAAACAGTACAGGACTGCAACTGCTCAATCT 242 GGAACGCCAGGACCACCAACGACAATACGACGACGTCGATTTGCTCGTTGGGGGTG 967 ActicaAdcatricterArandadecaGcGaCarGarGarGcarActrccCGGGrGCGrGCCT 2 receeggrigerentreterreterretergecerrereterreterrande. The polypeptide it encodes may be used in a system for detecting NANB hepatitis. This method is highly specific and sensitive, and can detect NANB hepatitis virus which could not be detected by

These fragments were amplified using the primers given in AAQ63732-51. These primers were used in the detection of NANBH. The primers are based on the 5'-terminal region and the core protein coding region. The method allows highly sensitive

NANB hepatitis virus strain HC-J4 was isolated from a plasma sample of a chimpanzee challenged with NANB hepatitis for infectivity but which tested negative for HCV antibody by Ortho HCV Ab ELISA test.

RNA was isolated from the sample and reverse transcribed into CDNA. The 513 amino acids encoded by the CDS were determined but are not given in the specification (and hence are not included in A Geneseq.) A study of the deduced sequence suggested that the CDS encodes NANBH virus core proteins. Primers for detecting NANB hepatitis virus were designed based on the HC-J4 sequence. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                        This sequence represents the 5' region of hepatitis C virus RNA. The original sample was obtained from human and chimpanzee plasma. RNA was isolated from several samples and homology compared, and the respective sequence of about 1900 - 2500 nucleotides of the 5' terminus and 1100 nucleotides of the 3' terminus determined. The 5' region (given) contains a non-coding region of at least 340 nucleotides and a region coding for the structural protein followed by a region coding for the non-structural protein followed by a region to the sequence given in the specification). When compared with the sequence of HCV disclosed in EP-388232 this sequence showed (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ATCCCGGCCATGTATCAGGTCACCGCATGGCTTGGGATATGATGATGAACTGGTC 476

The present sequence comprises the nucleic acid sequence of the central fectious hepatitis C virus (HCV) genotype 1b strain CC HC-14 (ATCC 209596) that is capable of expressing this virus when the carafected into cells. HC-14 was obtained from acute phase plasma of a chimpanzee experimentally infected with serum containing of a chimpanzee experimentally infected with serum containing of HC-14/91. The claimed infectious nucleic acid sequence can be used to produce chimentic genomes (see AAX24833) consisting of the open creading frames of infectious nucleic acid sequences of other cading frames of infectious nucleic acid sequences of other cading frames of infectious nucleic acid sequences in order to produce an attenuated HCV virus suitable contained acid sequences in order to produce an attenuated HCV virus suitable containe development. Infectious nucleic acid sequences can also be used to produce attenuated virus via passage in vitro or in vivo of the viruses produced by transfection of a host cell with vivo of the viruses produced by transfection of a host cell with contained to immunise mammals, especially humans, against hepatitis C used to immunise mammals, especially humans, against hepatitis C used to immunise mammals, rath nucleic acid sequences or their concoded proteases (e.g. NS3 protease) can additionally be used to concoded proteases (e.g. NS3 protease) can additionally be used to develop screening assays to identify antiviral agents for HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB 20; Length 9595;

The specification describes a nucleic acid comprising a chimeric virus genome, specifically bovine viral diarrhoea virus (BVDV) genome in which the (non-)structural region has been replaced by the (non-)structural region of a hepatitis C virus (HCV) genome. The nucleic acids comprising the chimeric virus and the chimeric virus are useful for identifying cell lines capable of supporting the replication of these chimeric viruses, in screening for neutralizing antibodies to HCV of different genotypes, in the production of HCV-BVDV virions, for the development of inactivated or attenuated vaccines to prevent HCV-BVDV in a mammal, 1206 361 421 Chimeric virus; bovine viral diarrhoea virus; BVDV; hepatitis C virus; HCV; vaccine; viral inhibitor; antiviral; ss. in studying the molecular properties of HCV indirectly in vitro, and in identifying inhibitors of viral enzyme activity which would be useful as antiviral agents. Formulations or compositions comprising the chimeric virions may be used to treat or prevent the signs and symptoms of HCV. The present sequence represents a HCV clone, which is used to construct chimeric nucleic acids of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  421
                                                                                   The present invention relates to GB virus-B. The nucleic acid molecules of the invention are useful for indirectly studying the molecular properties of hepatitis C virus (HCV). The infectious nucleic acid sequence of the GB virus-B clone and the HCV/GBV-B chimeras may be used
           New infectious nucleic acids of the GB virus-B clone, useful for indirectly studying the molecular properties of hepatitis C virus (HCV) and in developing vaccines and therapeutics for HCV

The isolated fragment can be used for the preparation of a vaccine for hepatitis C. The envelope region DNA for was derived from the serum of non-A, non-B hepatitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   181
                                                                                                                                                                                                                                                                                                                                  This mucieic acid sequence comprises the genome or infectious contains the nonstructural region of infectious genotype is contains the nonstructural region of infectious genotype is the contains the nonstructural region of infectious genotype is train HC-44 (see AAX24843). The construction of such chimeric nucleic acid sequences is expected to be of importance in studying the growth and virulence properties of HCV and in the production the growth and virulence properties of HCV and in the production of HCV suitable for conferring protection against multiple of HCV. The invention also relates to the introduction of mutations or delations into infectious nucleic acid sequences of mutations or delations into infectious nucleic acid sequences can also be used to produce attenuated virus value passage in vitro or in vivo of the produce attenuated virus values comprising one or more produced by transfection of a host cell with the infectious viruses produced by transfection of a host cell with the infectious polypeptides made from the infectious nucleic acid sequence are polypeptides made from the infectious nucleic acid sequence or also be used to immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus. The nucleic acid sequences or their immunity against the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GCGTTCGGGAGGCAACTCCTCCCGTTGCTGGGTGGCGCTCACTCCCACGCTCGCGGCCCA
